

# Spring 2015    Math 309    Topics for the Final Exam

## Logic. Know:

- Truth table of the negation operator, conjunction, disjunction, exclusive disjunction, implication and biconditional.
- How to form the negation of an implication and contrapositive, converse, and inverse of an implication
- All different ways of saying  $p$  implies  $q$
- How to prove tautologies, contradictions and logical equivalences using truth tables
- Logical equivalences, in particular distributive laws, De Morgan's laws and equivalences involving implications
- The meaning of the universal and the existential quantifier, and their negations
- How to work with nested quantifiers (how to state negations, how to recognize whether a statement is true or false and justify it, Exercises 26–33, 37, 38 and exercises on the web-site posted on April 4, 2017)
- The most important rules of inference: modus ponens, modus tollens, hypothetical syllogism, disjunctive syllogism and the rules of inference for quantified statements
- Proofs from Section 1.5 related to odd/even integers, rational and irrational numbers (Example 14, Example 18, Example 19, Example 21, Example 24, and the corresponding Exercises 20–30)
- A direct proof that  $\sqrt{2}$  is irrational posted on April 7, 2017.
- How to translate English sentences into logical propositions

## Sets and Functions. Know

- The concept of a set, equality of sets, the concept of a subset, the empty set, cardinality of a finite set, the power set, Cartesian product
- Different set notations, set builder notation, use of ellipses, Venn diagrams,
- Set operations: intersection, union, set difference, complement, symmetric difference, and the corresponding set identities
- Proving set identities using a membership table
- The formal definition of a function (web-site) and the concepts of domain, codomain and range
- Definitions of a surjection, an injection and a bijection; how to recognize and prove whether a given function has these properties (Exercises 12, 13, 14, 17, 18)
- The concept of composition of functions and the inverse function and connections to the previous item (Exercises 25, 26, 27)
- Properties of the floor and the ceiling and how to use them to solve related exercises (Examples 24, 25, Exercises 48, 49, 65, 66)

## Axioms and Propositions for $\mathbb{Z}$ . Know (The numbers in this section relate to the document “Basic properties of the Integers” posted on the class website)

- Section 2, all propositions.
- Section 3, Propositions 3.1, 3.2, 3.3, 3.6, Corollary 3.7.  $0 < 1$ . (In class I gave a proof by contradiction.)
- Definitions 3.9 and 3.10 and Exercises 3.11 and 3.12.
